

New Live Display

The new live display is one that everyone will see. The new display does not use Flash. We had to change as Flash is being phased out and has not been visible on any Mac platform products, including the iPhone, iPad, etc. as well as many Android phones. This new display is visible on all platforms and devices. The gauges update every 3 seconds to give you a truly live experience.

Here is how it works.

1. One gauge is used for Dew Point, Wind Chill and Humidex. You just need to choose what you want to see and click the circle to fill it in and the Dial will read whatever you choose. Furthermore it will remember that settings for the next time you visit.

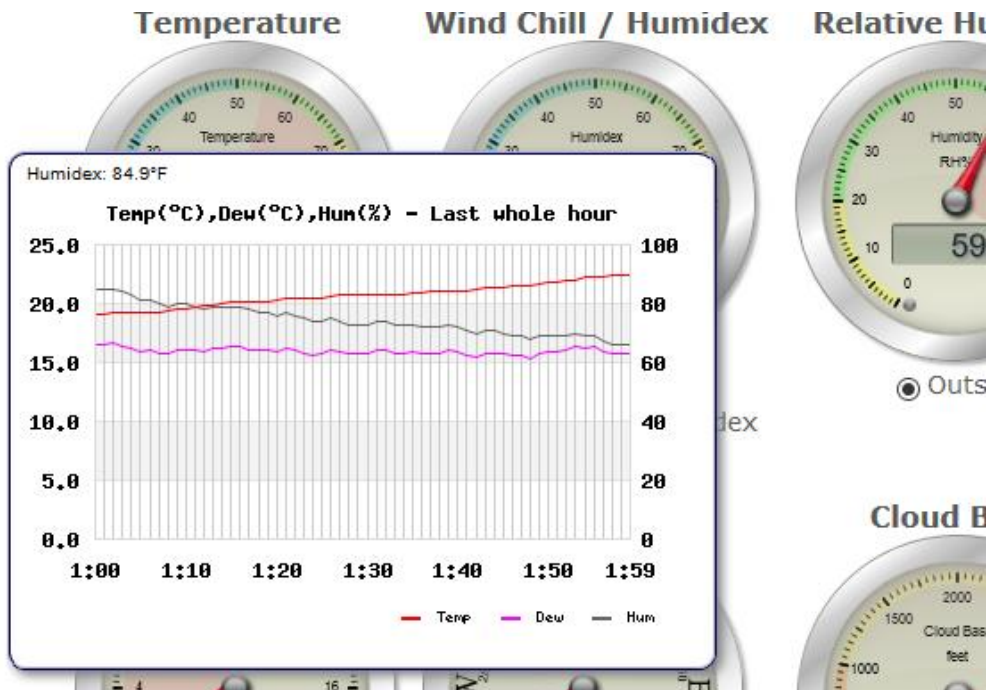

Wind Chill / Humidex

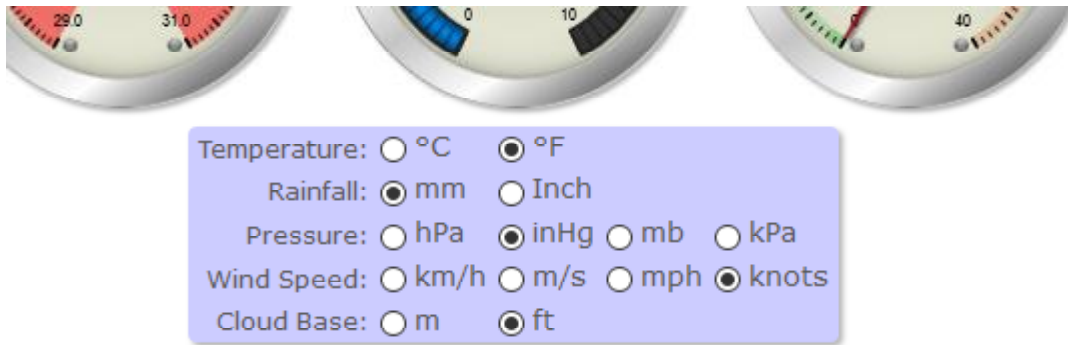

Dew Point

Wind Chill Humidex

2. A graph of the day can be activated by putting your cursor on the right edge of each Gauge. Once the cursor is positioned a graph will appear. To remove the graph move the mouse off the gauge. If you are on a phone or tablet, just tap the graph and it will disappear.

3. It is easier to customize the gauges to the units of measure that you are interested in. Just put the dots in the unit of measure that you want beneath the scales. The next time you come back to the site, your settings will be remembered.

Trend Plots

If you click the Trend Plots button on the red navigation bar you will be taken to a page with many graphs. Some hourly, daily, weekly, monthly and annually. If you are wanting to be analytical about the weather, this is the page for you.

Last 60 minute graphs
